Pelican Network

Private Signal View | PSV

A dedicated, single-strategy copy-trading destination — without the distraction of an open strategy marketplace.

What is a PSV?

A private, shareable URL showcasing just one signal provider, with their performance, portfolio and copying journey in one branded page.

Copiers can create an account or log in, link their trading account and start copying without navigating the main mobile or web application.

A signal provider or IB can create multiple dedicated views, each supporting a distinct distribution partner, affiliate link or audience.

Simple Client Onboarding

01. An IB or signal provider generates a dedicated PSV link in the IB Portal and shares it with prospective copiers.

02. The client opens the link, reviews the signal and signs in or registers directly on that page.

03. The client links their trading account, selects copying settings and begins copying from the same page.

04. The signal provider or IB can follow resulting copier activity and relevant fees through the IB Portal.

A Compelling Alternative to Traditional PAM / MAM Distribution

Private distribution: clients see the chosen provider rather than a competing catalogue of signals.

Greater transparency and choice for copiers: they can see individual trades and portfolio performance and can control when they begin or stop copying.

A new commercial model for IBs: they can receive an agreed performance-fee share even when they do not trade the signal themselves.

Flexible by design: Pelican can discuss tailored permissions or fixed copying configurations, including restrictions to prescribed lot-size settings.
